Dear Customer,
thank you for trusting our products and our family-owned company, the leading technology supplier of robots and production machines.

Our team is always available to answer any questions on this product and other solutions. Ask us questions and challenge us. We will find a solution!

Best regards,

Your SCHUNK team

1 About this manual

This manual contains important information for a safe and appropriate use of the product.

This manual is an integral part of the product and must be kept accessible for the personnel at all times.

Before starting work, the personnel must have read and understood this operating manual. Prerequisite for safe working is the observance of all safety instructions in this manual.

Illustrations in this manual are provided for basic understanding and may differ from the actual product design.

In addition to these instructions, the documents listed under (☞ 1.2, Page 6) are applicable.

1.1 Presentation of Warning Labels

To make risks clear, the following signal words and symbols are used for safety notes.

<table>
<thead>
<tr>
<th>Signal Word</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DANGER</td>
<td>Danger for persons! Non-observance will inevitably cause irreversible injury or death.</td>
</tr>
<tr>
<td>WARNING</td>
<td>Dangers for persons! Non-observance can lead to irreversible injury and even death.</td>
</tr>
<tr>
<td>CAUTION</td>
<td>Dangers for persons! Non-observance can cause minor injuries.</td>
</tr>
<tr>
<td>NOTICE</td>
<td>Material damage! Information about avoiding material damage.</td>
</tr>
</tbody>
</table>
1.2 Applicable documents

- General terms of business*
- Catalog data sheet of the purchased product *
- Calculation of the jaw centrifugal forces, "Technology" chapter in the lathe chuck catalog *

The documents marked with an asterisk (*) can be downloaded on our homepage schunk.com
2 Basic safety instructions

Improper handling, assembly and maintenance of this product may result in risk to persons and equipment if this operating manual is not observed.

Report any failures and damage immediately and repair without delay to keep the extent of the damage to a minimum and prevent compromising the safety of the product. **Only original SCHUNK spare parts may be used.**

2.1 Intended use

The product is suitable for clamping workpieces on milling or lathe machines and other suitable tooling machines.

- The product may only be used within the scope of its technical data, (☞ 6, Page 17).
- The product is intended for industrial and industry-oriented use.
- Appropriate use of the product includes compliance with all instructions in this manual.
- The maximum RPM of the chuck and the required clamping force must be determined by the user for the respective clamping task based on the applicable standards and technical specifications of the manufacturer. (See also “Calculations for clamping force and RPM” in the chapter “Technical data”). (☞ 6, Page 17)

2.2 Not intended use

A not intended use of the product is for example:

- It is used as a press, a punch, a toolholder, a load-handling device or as lifting equipment.
- the product is used for unintended machines or workpieces.
- the technical data is exceeded when using the product. (☞ 6, Page 17)
- if workpieces are not clamped properly, paying particular attention to the clamping forces specified by the manufacturer.
- if it is used in working environments that are not permissible.
- if the product is operated without a protective cover.
2.3 Notes on particular risks

This product may pose a danger to persons and property if, for example:

- It is not used as intended;
- It is not installed or maintained properly;
- The safety and installation instructions, local applicable safety and accident prevention regulations or the EC Machinery Directive are not observed.

**DANGER**

Possible risk of fatal injury to operating personnel if a jaw breaks or if the lathe chuck fails because the technical data have been exceeded and a workpiece is released or parts fly off

- The technical data specified by the manufacturer for using the lathe chuck must never be exceeded.
- The lathe chuck may only be used on machines and facilities that fulfill the minimum requirements of the EC Machinery Directive; specifically, they must have effective technical measures to protect against possible mechanical hazards.

**DANGER**

Possible risk of fatal injury to operating personnel from clothing or hair being caught on the lathe chuck and being dragged into the machine

Loose clothing or long hair may become caught on projecting parts of the lathe chuck and be drawn into the machine.

- The machines and equipment must fulfill the minimum requirements of the EC Machinery Directive; specifically, they must have effective technical measures to protect against potential mechanical hazards.
- Always wear tight-fitting clothing and a hairnet when working on the machine and the lathe chuck.
WARNING
Risk of injury due to dropping the chuck during transport, installation or removal.
• Take special care in the danger zone when transporting, installing or removing the chuck.
• Note the relevant load securing regulations for working safely with cranes, ground conveyors, lifting gear and load-handling equipment.

CAUTION
Danger of slipping and falling in case of dirty environment where the chuck is used (e.g. by cooling lubricants or oil).
• Ensure that the working environment is clean before starting assembly and installation work.
• Wear suitable safety shoes.
• Follow the safety and accident-prevention regulations when operating the chuck, especially when working with machine tools and other technical equipment.

CAUTION
Danger of limbs being crushed by opening and closing of the chuck jaws during manual loading and unloading or when replacing moving parts.
• Do not reach between the jaws.
• Wear safety gloves.
• Observe the safety and accident prevention regulations during operation of the chuck, especially in connection with machining centers and other technical equipment.

CAUTION
Risk of burns due to workpieces with high temperatures.
• Wear protective gloves when removing the workpieces.
• Automatic loading is preferred.
Basic safety instructions

<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Danger of damage due to incorrectly selected clamping position of the clamping jaws to the workpiece.</strong></td>
</tr>
<tr>
<td>An incorrectly selected clamping position of the clamping jaws to the workpiece can result in damage to the base and top jaws.</td>
</tr>
<tr>
<td>• Make sure that the workpiece clamping is concentric.</td>
</tr>
<tr>
<td>• In the case of a chuck with a quick-change jaw system the top jaws must not protrude radially beyond the base jaws used.</td>
</tr>
<tr>
<td><strong>Exception:</strong> The supporting jaw variant 3 protrudes beyond the chuck base jaw due to the construction of the jaw. In this case, the T-nuts must always be inserted completely into the groove of the chuck base jaw.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Hazard from vibration due to imbalanced rotating parts and noise generation.</strong></td>
</tr>
<tr>
<td>Physical and mental strains due to imbalanced workpieces and noise during the machining process on the clamped and rotating workpiece.</td>
</tr>
<tr>
<td>• Ensure the chuck's axial and concentric runout.</td>
</tr>
<tr>
<td>• Check options for remedying imbalances on special top jaws and workpieces.</td>
</tr>
<tr>
<td>• Reduce the speed.</td>
</tr>
<tr>
<td>• Wear hearing protection.</td>
</tr>
</tbody>
</table>

2.4 Notes on safe operation

• Do not start the machine spindle until the workpiece is clamped and the spanner wrench has been removed from the chuck.

• Only operate the lathe chuck when all protective equipment has been fitted and is in full working order.

• Check the lathe chuck at least once per shift for externally visible damage and faults.

**Functional test**

After installation of the lathe chuck, its function must be checked prior to start-up:

• **Clamping force!** At max. torque, the clamping force specified for the chuck must be reached.
Basic safety instructions

- **Indicator pin!** Never clamp or switch on the lathe when the indicator pin is protruding. (Golden pin on the chuck's shell).
- **Jaw lock!** The spindle can only be turned when all the chuck jaws have been fitted into the T-slot. This prevents the wedge bars from being brought into the working position without chuck jaws.

**Speed**

**DANGER**

Possible risk of fatal injury to operating personnel if the chuck's top speed is exceeded and a workpiece is released or parts fly off.

If the machine tool or technical equipment can reach a higher speed than the chuck's top speed, a reliable speed limiter must be installed and proof must be provided that the speed limiter is effective.

**WARNING**

Vibrations caused by the processing can result a loss of clamping force. Risk of injury due drop out of the workpiece.

Manually operated chucks can lose clamping force because of vibration which is caused by the processing of the workpiece.

- Tighten the chuck regularly during processing to compensate the loss of clamping force due to vibration.

**Maintenance instructions**

The manual chuck's reliability and safety can only be guaranteed if the operator complies with the manufacturer's maintenance instructions.

- For lubrication, we recommend our tried and tested special grease, LINOMAX plus. Unsuitable lubricants can have a negative impact on the functioning of the chuck (clamping force, coefficient of friction, wear characteristics). (For product information about LINOMAX plus, see the "Accessories" chapter of the SCHUNK lathe chuck catalog or contact SCHUNK.)
- Use a suitable high-pressure grease gun to ensure that you reach all the greasing areas.
- To ensure correct distribution of the grease, move the lathe chuck to its end positions several times, lubricate again, and then check the clamping force.
• We recommend checking the clamping force using a clamping force tester before starting a new production run and between maintenance intervals. *Optimum safety can only be guaranteed through regular checks*.

• The clamping force should always be measured with the chuck in the same condition as it is used in for the current clamping application. If top jaws with clamping steps are used, measuring must be performed in the same step as for the respective clamping task. In the event of high operating speeds, clamping force losses must be accounted for due to the centrifugal force acting on the chuck jaws. In this case the value of the operating clamping force should be measured dynamically.

• Move the lathe chuck through to its end position several times after 500 clamping strokes, at the latest. (This moves the lubricant back to the force transmission surfaces so that the clamping force is retained for longer).

**Safety notes for servicing**

Follow all the applicable legal standards for health and safety during servicing. Use suitable personal protective equipment, especially protective gloves, goggles, and safety boots - paying particular attention to the operating system and hazard assessment.

Immediately report any changes including operational behavior to the competent units/persons; if necessary, immediately shut down and secure the machine on which the lathe chuck is mounted. Do not start up the machine that the chuck is mounted on again until the malfunction has been eliminated.
DANGER

**Possible risk of fatal injury to operating personnel due to toolholder failure if the maintenance and servicing instructions for the toolholder are disregarded**

The servicing instructions specified by the manufacturer must be complied with to ensure safe operation of the chuck. Work must be carried out by qualified specialist personnel with the relevant safety training.

**Use of special chuck jaws**

When using special chuck jaws, please observe the following rules:

- The chuck jaws should be designed to be as light and as low as possible. The clamping point must be as close as possible to the chuck face (clamping points at a greater distance lead to greater surface pressure in the jaw guidance and can significantly reduce the clamping force).
- Do not use welded jaws.
- If for constructional reasons the special chuck jaws are heavier than the top jaws assigned to the clamping device, greater centrifugal forces must be accounted for when defining the required clamping force and the recommended speed.
- Screw the jaw mounting bolts into the bore holes furthest apart.
- The maximum recommended speed may only be operated in conjunction with the maximum clamping force and only with the lathe chuck in optimum, fully functioning condition.
- If the chuck is involved in a collision, it must be subjected to a crack test before using it again. Damaged parts must be replaced with original SCHUNK spare parts.
- Renew the chuck jaw mounting bolts if there are signs of wear or damage. Only use bolts with a quality of 12.9.
2.4.1 Constructional changes

Implementation of structural changes

By conversions, changes, and reworking, e.g. additional threads, holes, or safety devices can impair the functioning or safety of the product or damage it.

- Structural changes should only be made with the written approval of SCHUNK.

2.5 Personnel qualification

Assembly and disassembly, commissioning, operation and repair of the chuck may be performed only by qualified specialists who have been instructed with respect to safety.

All persons who are assigned to operate, maintain and repair our chuck must have access to the operating manual, especially the chapter “Fundamental safety instructions”. We recommend that the operator create in-house safety operating instructions.

Persons in training may be assigned to machines and technical equipment in which a chuck is mounted only if they are under the constant guidance and supervision of qualified specialists.

2.6 Organizational measures

Obeying the rules

Via suitable organizational measures and instructions, the operator must ensure that the relevant safety rules are obeyed by the persons asked to operate, maintain and repair the chuck.

Checking the behavior of personnel

The operator must at least occasionally check that the personnel are behaving in a safety conscious manner and are aware of the potential hazards.

Danger signs

The operator must ensure that the signs concerning safety and hazards mounted on the machine where the chuck is mounted are clearly legible and are observed.

Faults

If a fault occurs on the chuck and this fault endangers safety or if a problem is suspected due to production characteristics, the machine tool where the chuck is mounted must be immediately stopped and remain shut down until the fault has been located and remedied. Only allow specialists to remedy faults.
Spare parts
Only ever use original SCHUNK spare parts.

Environmental regulations
Comply with the applicable legal norms when disposing of waste.

2.7 Personal protective equipment

Use of personal protective equipment
Personal protective equipment serves to protect staff against danger which may interfere with their health or safety at work.

- When working on and with the product, observe the occupational health and safety regulations and wear the required personal protective equipment.
- Observe the valid safety and accident prevention regulations.
- Wear protective gloves to guard against sharp edges and corners or rough surfaces.
- Wear heat-resistant protective gloves when handling hot surfaces.
- Wear protective gloves and safety goggles when handling hazardous substances.
- Wear close-fitting protective clothing and also wear long hair in a hairnet when dealing with moving components.
3 Warranty

The warranty period is 60 months after delivery date from factory or 50,000 cycles*, if it is used as intended, under the following conditions:

- Observe the applicable documents, \((\text{\textsuperscript{1.2, Page 6}})\)
- Observe the ambient conditions and operating conditions.
- Observe the specified maintenance and lubrication intervals, \((\text{\textsuperscript{9, Page 34}})\)

Parts touching the workpiece and wear parts are not included in the warranty.

* A cycle consists of a complete clamping process ("Open" and "Close").

<td></td>
</tr>
</tbody>
</table>

The maximum RPM stated is only valid with the maximum clamping force and when using the hard standard stepped jaws that go with the chuck.

For soft top jaws or special chuck jaws the speed permitted for the cutting task must be calculated in accordance with VDI 3106 whereby the max. recommended speed of rotation may not be exceeded. The calculated values must be checked by dynamic measurement. Functional monitoring must be performed according to the guidelines of the insurance association.

**The recommended speed is valid for ROTA-S plus 2.0 with SCHUNK stepped block jaws, hard, type STF.**

For this, the base jaws are inserted flush with outer diameter of the chuck.

### 6.2 Clamping force / speed diagrams

Clamping force/RPM curves have been determined by using hard jaws. In the determination process, the maximum actuating force was applied and the jaws were set flush with the outer diameter of the chuck.

The chuck is in perfect condition and lubricated with SCHUNK LINOMAX plus special grease.

If one or more of these prerequisites is modified, the graphs will no longer be valid.

6.3.1 Calculation of the required clamping force in case of a given rpm

The initial clamping force $F_{sp0}$ is the total force impacting radially on the workpiece via the jaws due to actuation of the lathe chuck during shutdown. Under the influence of rotation, the jaw mass generates an additional centrifugal force. The centrifugal force reduces or increases the initial clamping force depending on whether gripping is from the outside inwards or from the inside outwards.

The sum of the initial clamping force $F_{sp0}$ and the total centrifugal force $F_c$ is the effective clamping force $F_{sp}$.

$$F_{sp} = F_{sp0} \mp F_c \ [N]$$

(−) for gripping from the outside inwards

(+) for gripping from the inside outwards
**DANGER**

Risk to life and limb of the operating personnel and significant property damage when the RPM limit is exceeded! With gripping from the outside inwards, and with increasing RPM, the effective clamping force is reduced by the magnitude of the increasing centrifugal force (the forces are opposed). When the RPM limit is exceeded, the clamping force drops below the required minimum clamping force $F_{sp\text{min}}$. Consequently, the workpiece is released spontaneously.

- Do not exceed the calculated RPM.
- Do not fall below the necessary minimum clamping force.

---

Reduction in effective clamping force by the magnitude of the total centrifugal force, for gripping from the outside inwards.

The required effective clamping force for machining $F_{sp}$ is calculated from the product of the **machining force** $F_{spZ}$ and the **safety factor** $S_z$. This factor takes into account uncertainties in the calculation of the machining force. According to VDI 3106: $S_z \geq 1.5$.

$$F_{sp} = F_{spZ} \cdot S_z \text{ [N]}$$

From this we can derive the calculation of the initial clamping force during shutdown:

$$F_{sp0} = S_p \cdot (F_{sp} \pm F_c) \text{ [N]}$$

($+$) for gripping from the outside inwards  
($-$) for gripping from the inside outwards
Technical data

**NOTICE**

This calculated force must not be larger than the maximum clamping force $\Sigma S$ engraved on the chuck. See also "Chuck data" table (§6.1, Page 17)

From the above formula it is evident that the sum of the effective clamping force $F_{sp}$ and the total centrifugal force $F_c$ is multiplied by the safety factor for the clamping force $S_{sp}$. According to VDI 3106, the following also applies here: $S_{sp} \geq 1.5$.

The total centrifugal force $F_c$ is dependent on both the sum of the masses of all jaws and on the center of gravity radius and the rpm.

**NOTICE**

For safety reasons, in accordance with DIN EN 1550, the centrifugal force may be a maximum of 67% of the initial clamping force.

The formula for the calculation of the total centrifugal force $F_c$ is:

$$F_c = \sum (m_B \cdot r_s) \cdot \left(\frac{\pi \cdot n}{30}\right)^2 = \sum M_c \cdot \left(\frac{\pi \cdot n}{30}\right)^2 [N]$$

For this, $n$ is the given speed of rotation in RPM. The product $m_B \cdot r_s$ is referred to as the centrifugal force torque $M_c$.

$$M_c = m_B \cdot r_s [kgm]$$

In case of toolholders with split chuck jaws, i.e., with base jaws and top jaws, for which the base jaws change their radial position only by the stroke amount, the centrifugal torque of the base jaws $M_{cGB}$ and the centrifugal torque of the top jaws $M_{cAB}$ need to be added:

$$M_c = M_{cGB} + M_{cAB} [kgm]$$

The centrifugal torque of the base jaws $M_{cGB}$ can be found in the table "Chuck data" (§6.1, Page 17). The centrifugal torque of the top jaws $M_{cAB}$ is calculated as per:

$$M_{cAB} = m_{AB} \cdot r_{SAB} [kgm]$$

### 6.3.2 Calculation example: Required initial clamping force $F_{sp0}$ for a given rpm $n$

The following data is known for the machining job:

- Gripping from the outside in (application-specific)
- Machining force $F_{spz} = 3000$ N (application-specific)
Technical data

- max. speed of rotation \( n_{\text{max}} = 3200 \text{ rpm} \) ("Chuck data" table)
- RPM \( n = 1200 \text{ rpm} \) (application-specific)
- Mass of one (!) top jaw \( m_{\text{AB}} = 5.33 \text{ kg} \) (application-specific)
- Center of gravity radius of top jaw \( r_{\text{sAB}} = 0.107 \text{ m} \) (application-specific)
- Safety factor \( S_z = 1.5 \) (according to VDI 3106)
- Safety factor \( S_{\text{sp}} = 1.5 \) (according to VDI 3106)

**Note:** Masses of the jaw mounting screws and T-nuts are not taken into account.

First the required effective clamping force \( F_{\text{sp}} \) is calculated using the machining force stated:

\[
F_{\text{sp}} = F_{\text{spz}} \cdot S_z = 3000 \cdot 1.5 \rightarrow F_{\text{sp}} = 4500 \text{ N}
\]

Initial clamping force during shutdown:

\[
F_{\text{sp0}} = S_{\text{sp}} \cdot (F_{\text{sp}} + F_c)
\]

Calculation of total centrifugal force:

\[
F_c = \sum M_c \cdot \left(\frac{\pi \cdot n}{30}\right)^2
\]

For two-part chuck jaws, the following applies:

\[
M_c = M_{\text{CGB}} + M_{\text{CAB}}
\]

Centrifugal torque of base jaw and top jaw specified in "Chuck data" table:

\[
M_{\text{CGB}} = 0.319 \text{ km}
\]

For the centrifugal torque of the top jaw, the following applies:

\[
M_{\text{CAB}} = m_{\text{AB}} \cdot r_{\text{sAB}} = 5.33 \cdot 0.107 \rightarrow M_{\text{CAB}} = 0.57 \text{ km}
\]

Centrifugal torque for one jaw:

\[
M_c = 0.319 + 0.571 \rightarrow M_c = 0.89 \text{ km}
\]

The chuck has 3 jaws, the total centrifugal torque is:

\[
\sum M_c = 3 \cdot M_c = 3 \cdot 0.889 \rightarrow \sum M_c = 2.667 \text{ km}
\]

The total centrifugal force can now be calculated:

\[
F_c = \sum M_c \cdot \left(\frac{\pi \cdot n}{30}\right)^2 = 2.668 \cdot \left(\frac{\pi \cdot 1200}{30}\right)^2 \rightarrow F_c = 42131 \text{ N}
\]

Initial clamping force during shutdown that was sought:

\[
F_{\text{sp0}} = S_{\text{sp}} \cdot (F_{\text{sp}} + F_c) = 1.5 \cdot (4500 + 42131) \rightarrow F_{\text{sp0}} = 69947 \text{ N}
\]
6.3.3 Calculation of the permissible rpm \( n_{zul} \) in case of a given initial clamping force \( F_{sp0} \)

The following formula can be used to calculate the permissible RPM for a given initial clamping force during shutdown:

\[
n_{zul} = \frac{30}{\pi} \cdot \sqrt{\frac{F_{sp0} - (F_{spz} \cdot S_z)}{\sum M_c}} \quad \text{[min}^{-1}]\]

**NOTICE**

The calculated permissible RPM may not exceed the maximum RPM inscribed on the chuck for safety reasons!

Example of calculation: Permissible RPM for a given effective clamping force

The following data is known from previous calculations:

- Initial clamping force during shutdown \( F_{sp0} = 17723 \text{ N} \)
- Machining force for machining job \( F_{spz} = 3000 \text{ N} \) (application-specific)
- Total centrifugal torque of all jaws \( \sum M_c = 2,668 \text{ kgm} \)
- Safety factor \( S_z = 1.5 \) (according to VDI 3106)
- Safety factor \( S_{sp} = 1.5 \) (according to VDI 3106)

**NOTE:**

Masses of the jaw mounting screws and T-nuts are not taken into account.

Identifying the permissible RPM:

\[
n_{zul} = \frac{30}{\pi} \cdot \sqrt{\frac{17723 - (3000 \cdot 1.5)}{2,668}} = \frac{30}{\pi} \cdot \sqrt{\frac{69947 - (3000 \cdot 1.5)}{2,668}} \Rightarrow n_{zul} = 1495 \text{ min}^{-1}
\]

The calculated RPM \( n_{zul} = 1495 \text{ rpm} \) is smaller than the maximum permissible RPM of the chuck \( n_{max} = 3200 \text{ rpm} \) (see "Chuck data" table (\(\text{\smaller 6.1, Page 17}\)).

This calculated RPM may be used.

6.4 Grades of Accuracy

Tolerances for run-out accuracy and axial run-out accuracy correspond to the Technical Supply Terms for lathe chucks as per DIN ISO 3089.

6.5 Permissible imbalance

The permissible imbalance for lathe chucks is quality class G 6.3 as per DIN ISO 21940-1.
7 Attachment of the manual chuck

The item numbers specified for the corresponding individual components relate to chapter drawings. (page 40)

7.1 Handling prior to attachment

Before mounting on the lathe, remove the base jaws from the chuck, then re-install the base jaws and turn the spindle several times as far as it will go to the right and left.

- Use the spanner wrench to turn the spindle (item 8) as far as possible to the left.
- Press the thrust bolt (item 14) under the first jaw (item 4). The base jaw is now free to move.
- Remove the base jaw and push it into the chuck again while pressing the thrust bolt (item 14) until the front side of the jaw is at the outer marking line.
- The first tooth of the base jaw holds the locking slide (item 13) in the lower position and the actuating lock for the respective jaw is released.
- Proceed in this way for all 3 base jaws.

The numbered jaws have to be pushed into the correspondingly numbered guidance (jaw 1 into guidance 1 etc.).

Finally turn the spindle several times to the right and to the left until it bottoms out.

7.2 Preparing the chuck attachment

- Check the machine table and ready-machined intermediate flange for radial and axial runout. Permissible are 0.005 mm to DIN 6386 and ISO 3089.
- The contact surface must be chamfered and clean at the bores. Rectify any damage of the spindle nose supporting surfaces. For the flange spindle, check the contact surface with a straight edge.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
</table>

When mounting with the intermediate flange, never allow the outer rim of the chuck body to make contact. The flange must support on the entire surface.
Attachment of the manual chuck

ROTA-S plus 2.0 chucks are delivered with different short taper mountings. For the type C bayonet mounting, for the type S Camlock mounting and with the intermediate flange for type A short taper. (Our technical sales would be glad to answer any questions you may have.)

7.3 Mounting of the Manual Chuck

Thoroughly clean the centering and the bearing surfaces of both parts and lubricate them with oil before placing the chuck onto the spindle head. When the chuck is slightly pressed, there should be a noticeable play and between the faces there should be a gap of max. 0.02 mm (feeler gauge).

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Danger of damage of the thrust bolt (item 14) when setting down the chuck on the thrust bolt (for example, for cleaning or maintenance). Never put the chuck onto the thrust bolt (item 14)!</td>
</tr>
</tbody>
</table>
8 Function

The item numbers specified for the corresponding individual components relate to chapter drawings. (☞12, Page 40)

8.1 Handling and jaw change

NOTE:
For rotating lathe chucks, the centrifugal forces applied can cause the indicator pin to emerge from the chuck body. When the lathe chuck comes to a stop, the indicator pin must be reinserted.

- Use the spanner wrench to turn the spindle (item 8) as far as possible to the left. The indicator pin (item 17) protrudes from the chuck body by about 4 to 5 turns before the stop (gold-colored pin).

⚠️ WARNING

If the indicator pin protrudes, the entire serration of the wedge bars (items 5 and 6) no longer engages into the base jaws. The base jaws are not sufficiently engaged by the wedge bars. Risk of injury from jaws and workpiece being flung out.

- If the indicator pin protrudes, do not clamp the chuck and do not start up.
- Once the spindle (item 8) has reached the stop, press the pressure bolt (item 14) under the base jaw. The corresponding jaw is released and can now be adjusted or exchanged.

⚠️ NOTICE

If the pressure bolt (item 14) is stuck or does not move easily, it must be removed and cleaned (see chapter "Disassembling and assembling the chuck") (☞9.1, Page 34). Do not use force (for example, hammer blows etc.) to loosen the pressure bolt, since this could damage the slide (item 13), which in turn could impair the safety mechanism.

Oil the cleaned pressure bolt; do not grease with chuck grease!
- Adjust exchanged jaws until the desired clamping diameter has been reached. The slides (item 12) must snap in when doing this.
Function

**NOTICE**

Actuating the chuck if a jaw is not engaged will damage the chuck!
Manually move the jaw back and forth without actuating the pressure bolt. This ensures that the jaw is engaged. The pressure bolt has to be in the initial position.

For all the wedge bar teeth (items 5 and 6) to be supportive, the base jaws in the guides must always be inserted at least up to the marking line on the chuck body (item 1) (see Fig. "Jaw change"). All jaws have to be at the same marking line. An additional actuating lock prevents the spindle from being turned to the right without chuck jaws.

**NOTICE**

If force is used to continue turning, the chuck will be damaged and the jaw lock function will no longer be active.
Do not forcefully turn the spindle further!

Only after all the clamping jaws have been inserted into the guide will the actuating lock be unlocked. Then the wedge bars can be shifted into working position. (Turn spindle to the right!)
In the event of noticeable resistance (jaw not engaged), do not turn further forcefully. Slightly move the base jaw until it engages.

The base jaws fit into the chuck in both directions. They can be turned around.

![Jaw change](image)

**Jaw change**
If you turn the spindle to the right, the indicator pin (item 17) will protrude from the chuck body (item 1) (gold-colored pin) shortly before the stop.

**WARNING**

If the indicator pin protrudes, the entire serration of the wedge bars (items 5 and 6) no longer engages into the base jaws. The base jaws are not sufficiently engaged by the wedge bars. Risk of injury from jaws and workpiece being flung out.

- If the indicator pin protrudes, do not clamp the chuck and do not start up.

### 8.2 Important notes

When working with a very short opening stroke or large series, lubrication grease may be pressed out between the loaded surfaces of the chuck gear. In this case efficiency will decrease!

Following a number of clampings, activate the chuck several times without a workpiece inserted at full stroke so that the grease can be distributed evenly again on the sliding areas on the inside of the chuck. The chuck will then attain its full clamping force again.

- Never remove the base jaws without actuating the thrust bolt (item 14).
- Tighten the chuck regularly during processing to compensate the loss of clamping force due to vibration.
- Following a longer period of shutdown (more than 8 hours), always re-tension the clamped toolholder in order to compensate for the spindle settling and the resulting loss of clamping force.
- When gripping the spanner wrench, do not tighten with an extension pipe or using hammer blows. Only grip using the flangemounted chuck!
- Do not flange-mount the chuck against the edge of the chuck body!
- Never clamp the base jaws outside the marked lines (8.1, Page 29)!
- Do not use force (e.g. hammer blows) to move jaws that are difficult to move. Clean the guides and jaws.
- Subsequently delivered hard top jaws (type SHF) or unsplit, hard jaws (type STF) must be ground in the chuck for run-out accuracy.
• For precise clamping, do not remove the ground top jaws from the base jaws. This will result in loss of true-running accuracy. Use a different set of jaws when changing the jaws.

• When re-equipping from cylindrical mounting to short-taper flange, the lid (item 2) must be removed if the centering lid is used.

8.3 Control of the chuck

The Manual Chuck ROTA-S plus can be only inspected in flanged position. The round and planar surfaces in the rear area of the chuck body area must run true. The jaws must be just as easy-to-move after attachment as beforehand (\textit{\textsuperscript{9.1, Page 34}}).

\textbf{If the jaws are more difficult to move than before attachment, the chuck body has been incorrectly attached. The chuck may have become twisted.}

8.4 Control of true-running

(For delivery of a ROTA-S plus 2.0 with hard jaws STF/SHF grounded on the chuck)

For control of true-running and face play hardened and ground inspection arbors or inspection disks are clamped (see illustration "Control of true-running"). The torque (Md) at the key during tensioning of the inspection arbors and inspection disks corresponds to ca. 67% to the max. chuck operating torque. You can read off the values, diameters of the inspection arbors as well as the position of the measuring table according to the jaws, on the below chart.

If the admissible T.I.R or face play error (compare chart below) are exceeded, check the following points:

• the tightening torque of the key (Md)
• the correct mounting of the chuck
• does the inspection arbor- and inspection disk diameter deviate from the factory settings.

\textbf{Chart of the max. admissible T.I.R. and face play error at the ROTA-S plus 2.0 Chuck with STF- or SHF-jaws}

**Diagram:**

Control of true-running
9 Maintenance

The item numbers specified for the corresponding individual components relate to chapter drawings. ([12, Page 40])

A high bearing load capacity with a secure workpiece clamping device can only be guaranteed with regular lubrication using a high-performance lubricant.

For this reason, it is recommended to regularly clean the chuck and lubricate it using SCHUNK LINOMAX plus special grease.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allergic reactions due to grease in contact with skin!</td>
</tr>
<tr>
<td>Wear gloves.</td>
</tr>
</tbody>
</table>

The chuck will have to be disassembled and cleaned at regular intervals according to its application.

9.1 Disassembling and assembling the chuck

Disassembly

When replacing spare parts or cleaning, the chuck will have to be disassembled.

- First remove the manual chuck from the lathe.

Note for the corresponding mountings:

- For the direct mounting in acc. with DIN ISO 702-1:
  Evenly loosen the mounting screws (item 35) and remove the chuck from the spindle.

- For the direct mounting in acc. with DIN ISO 702-3 (bayonet):
  Loosen flanged nut, twist the bayonet disk and take the chuck out of the spindle.

- For the direct mounting in acc. with DIN ISO 702-2 (Camlock):
  Unlock the Camlock bolts and take the chuck out of the spindle.

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Risk of injury due to dropping the manual chuck during transport, installation or removal</td>
</tr>
<tr>
<td>During transport and when installing or detaching the manual chuck, ensure it does not fall off.</td>
</tr>
</tbody>
</table>
• Remove the jaws from the guideways (see chapter "Handling and jaw changes" (☞ 8.1, Page 29)).

• Place the chuck on its front, undo the screws (item 34) and remove the cover (item 2).

• When taking out the drive ring (item 3), pay attention to the indicator pin (item 17) which has been pre-loaded by the spring (item 38).

• Take the spring and the indicator pin out of the bore hole in the chuck body (item 1).

• Pull off the sliding blocks (item 7) from the wedge bars (items 5 and 6) and carefully remove the O rings (item 39).

• Remove the cylindrical pin (item 30).

• Insert the assembly key (item 99) using the spindle's hexagonal head (item 8) and unscrew the spindle screw (item 8) with the actuation key. The spindle (item 8) can now be completely screwed out of the wedge bar (item 5) with the actuation key.

• The pressure bolts (item 14) are pre-loaded by the springs (item 31). After the cylindrical pins (item 45) are driven out of the chuck body with a suitable sliding hammer, the springs (item 31) and the pressure bolts (item 14) can be removed.

• Carefully remove the wedge bars (items 5 and 6) from the chuck body (item 1) and take off the locking slide (item 13) with the spring (item 32), the traverse slide (item 15) and the slide (item 12).

• Unscrew the screws (item 36) and remove the wipers (item 11).

• Take the seat of bearing (item 10) out of the chuck body.

The chuck is now completely disassembled.

Clean all parts carefully with degreasing agent and check for wear and damage.

**Replace damaged parts with original SCHUNK spare parts only!**

Before installation, lubricate all individual components with LINOMAX plus grease.
Assembly
The chuck is assembled in the reverse order. Observe the following when doing this:

- **Do not forget any parts! Even small components are essential for the safety of the lathe.**
- **When assembling the spindle (item 8), be sure not to tighten the spindle nut (item 9).**
  Turn the spindle nut (item 9) on the block and then turn it back until a surface on the spindle nut (item 9) can be seen through the hole of the cylindrical pin (item 30) in the chuck body (item 1). Insert the cylindrical pin (item 30) in this orientation.
- When inserting the drive ring (item 3), the position of the control area for the indicator pin (item 17) must be noted. If the drive ring (item 3) is incorrectly mounted, then the indicator pin (item 17) is not pulled in during the actuation of the chuck.

9.2 Jaw change
Clean and lubricate jaws if there is no film of grease.

9.3 At least once a month
Lubricate the chuck at the two lubrication nipples (item 37) on the circumference of the chuck body (item 1) using a manual press. Use SCHUNK LINOMAX plus special grease as lubricant.
The chuck must be in fully the open position (jaw change position) so that all the important areas are covered with grease by the lubrication system.
- The functional surfaces of the wedge bars (items 5 and 6) and the drive ring (item 7) are reached via the lubrication nipple opposite jaw 1. The second greasing area supplies grease to the spindle bearings and the spindle thread.
- After lubricating, open and close the chuck 2 – 3 times without a workpiece to evenly distribute the grease across all the functional surfaces.
9.4 In the case of decreasing clamping force or after approx. 200 operating hours

If the clamping force decreases, the inside of the chuck is contaminated or the coolant has washed out or decomposed the grease.

In this case disassemble the chuck, carefully clean all parts with degreasing agent and check for wear and damage.

**Replace damaged parts with original SCHUNK spare parts only!**

Before installation, lubricate all individual components with SCHUNK LINOMAX plus special grease.

This cleaning procedure should be performed about every 200 operating hours, depending on the extent of stress on the chuck.

9.5 Maintenance intervals

**Lubrication of the grease areas:**

<table>
<thead>
<tr>
<th>Lubrication interval</th>
<th>Strain</th>
</tr>
</thead>
<tbody>
<tr>
<td>every 25 hours</td>
<td>normal / coolant utilization</td>
</tr>
<tr>
<td>every 8 hours</td>
<td>high / coolant utilization</td>
</tr>
<tr>
<td>after 1200 hours or as needed</td>
<td>Total cleaning with disassembly of the chuck, depending on type and degree of contamination</td>
</tr>
</tbody>
</table>
10 Disposal

After decommissioning, place the chuck in a position that enables any liquids in the chuck to drain out.

- Collect the escaping liquids and dispose of them properly in line with the statutory provisions.
- Remove any identifiable plastic or aluminum parts installed in or on the chuck and dispose of them properly in line with the statutory provisions.
- Dispose of the chuck’s metal parts as scrap metal.

Alternatively, you can return the chuck to SCHUNK for proper disposal.
11 Spare parts

When ordering spare parts, it is imperative to specify the type, size and above all the manufacturing no of the chuck.

Seals, sealing elements, screw connections, springs, bearings, screws and wiper bars plus parts coming into contact with the workpiece are not covered by the warranty.
